

# Backups

Rob Limbaugh  
March 2, 2010

# Agenda

- ◆ Explain of a Backup and purpose
- ◆ Habits
- ◆ Discuss Types
- ◆ Risk/Scope
- ◆ Disasters and Recovery Options
- ◆ Software, Hardware
- ◆ Suggestions and Examples

# What are Backups?

- ◆ A backup is used to restore data to a previous state/condition
- ◆ A backup is a duplicate of system, application, configuration, and user data.
- ◆ A backup may contain all or parts of system, application, configuration, or user data.

All recovery plans start with backups

# Change some habits

- ◆ Know where data is stored on your machine for your OS/device
- ◆ Organize your data storage
- ◆ Do not assume all backups are good
- ◆ Do not let local copies be your only backup strategy
- ◆ Personal and Business backups have different risk assessments and needs – know them.
- ◆ Learn from the failures of others

# Types of backups

- ◆ Ad-hoc/Unstructured – pile of CDs, floppies, etc.
- ◆ Full – All files/data
- ◆ Incremental – files/data changed since last backup
- ◆ Differential – all files changed since last full
- ◆ Mirroring – (RAID1) replication of disk media in real time
- ◆ Continuous – byte/block level

# Cost is relative to risk and scope

- ◆ Risk – What loss is acceptable?
- ◆ Scope – What do I need to back up and for how long?
- ◆ Cost – Consider the following factors:
  - ◆ Sentimental value
  - ◆ Media/equipment cost for implementation
  - ◆ Software cost
  - ◆ Costs for recovery
  - ◆ Legal responsibility

# Disasters

- ◆ **Delete/overwrite file**
- ◆ **System failure resulting in damaged/corrupted/inaccessible hard drive or contents**
- ◆ **External disasters – lightning, flood, fire, collapse, physical destruction**
- ◆ **Theft**

# Recovery Options

- ◆ **Delete/Overwrite:** Use 'Recycle Bin', 'Time Machine', 'Previous Versions', 'Back In Time', or restore from external media
- ◆ **System failure:** Repair/replace hardware and restore from external media
- ◆ **External disasters:** Repair/replace hardware and restore from external media
- ◆ **Theft:** Replace hardware and restore from external media

# If you were paying attention

- ◆ 25% of the previous examples could make use of simple backup techniques that are built into an OS.
- ◆ 75% of the previous examples required backups on external storage
- ◆ 75% of the previous examples required hardware repairs/replacement
- ◆ 50% of the previous examples could be total catastrophic loss

# Minimizing Catastrophic Loss

- ◆ **Single Point of Failure** – the point where your options fail to help you realize your intended goal(s).
- ◆ If you cannot afford to lose **ALL** of your data, then you **MUST** be utilizing ‘Off Site Storage’
- ◆ Disasters and thieves do not discriminate in what they destroy or remove. Backups in the same room as the computer are useless in these events.

# What should I do?

- 1. Start with a full system backup to external media and put it in a safe place**
- 2. Make a list of a data and the locations to better pinpoint future backups if a 'full' is not always needed.**
- 3. Determine a schedule to back up data**

# Software

- ◆ **Look in your OS**
  - ◆ Time Machine
  - ◆ Previous Versions
  - ◆ Recycle Bin
- ◆ **Check web for backup software**
- ◆ **Look at DVD burning software**
- ◆ **Utilities such as Recuva which scan media locations for deleted/erased files**

# Off-Site Storage Options

- ◆ Backup to external media (CD, DVD, Tape, USB Hard Drive) and store in safe location
- ◆ Use online backup solutions such as Mozy, Carbonite, Acronis, Amazon S3, etc.
- ◆ Service providers such as Iron Mountain

A car is NOT an 'off-site storage' location unless it's for your own personal data nobody else cares about.

# What Does Rob do?

- ◆ **Combination of Continuous Backup and Removable Media**
- ◆ **One USB drive used as consolidated removable media backup on a periodic basis for each system including file server**
- ◆ **Each system is periodically backed up to file server**
- ◆ **File server runs continuous backup software that backs data up to account online.**

# Why Does Rob Do That?

- ◆ Rob is lazy and does not want to switch around tapes and drives or store them in special places
- ◆ Rob is cheap and does not want to buy tapes and drives at \$50+ each.
- ◆ Rob wants the ability to restore all his data in the event of a ‘Catastrophic Loss’
- ◆ Rob minimizes risk by forcing copies of critical data when necessary

# Rob's Costs

- ◆ 1TB USB hard drive for removable media (\$100 value—was a gift)
- ◆ “Server” with 500TB space – reused system with reused drives: free
- ◆ Carbonite: \$50/yr
- ◆ Scope: Data from 4 users, 6 computers, with ability to recover key data within hours from anywhere that has an internet connection. All other data can throttle in the background.

# Let's take a look

- ◆ Using a tool such as Recuva
- ◆ Using Windows 7 features
- ◆ Options for Linux
- ◆ Options for Mac
